$\begin{array}{c} \text{Math 320 Linear Algebra} \\ \text{Assignment } \# \ 10 \end{array}$

- 1. In this problem we are going to prove an important theorem. Let V and W be vectors spaces and $T:V\to W$ be an isomorphism (a 1-1 and onto linear transformation). Furthermore let $\mathscr{B}=\{\vec{v_1},\vec{v_2},\ldots,\vec{v_r}\}\subseteq V$ and $\mathscr{D}=\{T(\vec{v_1}),T(\vec{v_2}),\ldots,T(\vec{v_r})\}\subseteq W$.
 - (a) If \mathscr{B} is linearly independent in V then show that \mathscr{D} is linearly independent in W. Here is a video: Isomorphism Question Part a that will help with this part.
 - (b) If \mathscr{B} is spans V then \mathscr{D} spans W. Here is a video: Isomorphism Question Part b that will help with this part.
 - (c) If \mathscr{B} are a basis for V then \mathscr{D} are a basis for W.

 (Hint: this should be very straight forward from the previous part)
- 2. Consider $V = \mathbb{R}^{2 \times 2}$ and let

$$\mathscr{B} = \left\{ \begin{bmatrix} 1 & 1 \\ 0 & 0 \end{bmatrix}, \begin{bmatrix} 1 & 1 \\ 1 & 0 \end{bmatrix}, \begin{bmatrix} 2 & 0 \\ 0 & 0 \end{bmatrix}, \begin{bmatrix} 1 & 1 \\ 1 & 1 \end{bmatrix} \right\}$$

- (a) What is $\dim V$
- (b) Show that \mathcal{B} is linearly independent.
- (c) Why can you conclude from above that \mathscr{B} is a basis for V?
- (d) Let

$$A = \begin{bmatrix} 2 & 4 \\ 1 & 1 \end{bmatrix}$$

Find $[A]_{\mathscr{B}}$. (Hint: Your answer should be an element of \mathbb{R}^4 . Remember the order of \mathscr{B} matters.)

3. Let $T: \mathbb{R}^{2\times 2} \to P_2$ be defined by:

$$T\left(\begin{bmatrix} a & b \\ c & d \end{bmatrix}\right) = bx^2 + bx + c$$

(Hint: Only the first problem should require much in the way of work)

- (a) Find a basis for ker(T).
- (b) Find $\dim(\ker(T))$.
- (c) Find $\dim(\operatorname{Rg}(T))$
- (d) Find a basis for Rg(T)
- (e) Is T onto?
