

Problems from Assignment 5

1. For this problem you may use the following integrals when $a > 0$ and $n \in \mathbb{N}$:

$$\int_0^a \left(1 - \frac{x}{a}\right)^{n-1} dx = \frac{\theta}{n}$$

$$\int_0^a x \left(1 - \frac{x}{a}\right)^{n-1} dx = \frac{\theta^2}{n(n+1)}$$

$$\int_0^a x^2 \left(1 - \frac{x}{a}\right)^{n-1} dx = \frac{2\theta^3}{n(n+1)(n+2)}.$$

Suppose $X_1, X_2, \dots, X_n \stackrel{\text{iid}}{\sim} \mathcal{U}(0, \theta)$ and let X_{\min} be the minimum of the n values.

- Find the pdf of X_{\min} . (Hint: $F_{X_{\min}}(x) = 1 - \mathbb{P}(X_{\min} > x)$.)
- Check that it is indeed a pdf.
- Find $\mathbb{E}(X_{\min})$.
- Choose c so $\hat{\theta}_1 = cX_{\min}$ is an unbiased estimator.
- Find $\text{Var}(X_{\min})$.
- Compare this to $\text{Var}(X_{\max})$ that we did in class, and explain why this makes sense.
- Find $\text{Var}(\hat{\theta}_1)$.
- How does the efficiency compare to $\hat{\theta} = \frac{n+1}{n}X_{\max}$.
